### REC\_DS using C\_Week 4\_COD\_Question 5

Attempt : 1  
Total Mark : 10  
Marks Obtained : 10

#### Section 1 : Coding

##### 1. Problem Statement

You are tasked with implementing basic operations on a queue data structure using a linked list.

You need to write a program that performs the following operations on a queue:

Enqueue Operation: Implement a function that inserts an integer element at the rear end of the queue. Print Front and Rear: Implement a function that prints the front and rear elements of the queue. Dequeue Operation: Implement a function that removes the front element from the queue.

##### ***Input Format***

The first line of input consists of an integer N, representing the number of elements to be inserted into the queue.

The second line consists of N space-separated integers, representing the queue elements.

### **Output Format**

The first line prints "Front: X, Rear: Y" where X is the front and Y is the rear elements of the queue.

The second line prints the message indicating that the dequeue operation (front element removed) is performed: "Performing Dequeue Operation:".

The last line prints "Front: M, Rear: N" where M is the front and N is the rear elements after the dequeue operation.

Refer to the sample output for the formatting specifications.

### **Sample Test Case**

Input: 5

12 56 87 23 45

Output: Front: 12, Rear: 45

Performing Dequeue Operation:

Front: 56, Rear: 45

### **Answer**

```
#include <stdio.h>
#include <stdlib.h>
```

```
struct Node {
    int data;
    struct Node* next;
};
```

```
struct Node* front = NULL;
struct Node* rear = NULL;
```

```
void enqueue(int data) {
    struct Node* newNode = (struct Node*)malloc(sizeof(struct Node));
    newNode->data = data;
    newNode->next = NULL;
```

```
    if (rear == NULL) {  
        front = rear = newNode;  
    } else {  
        rear->next = newNode;  
        rear = newNode;  
    }  
}
```

```
void dequeue() {  
    if (front == NULL) {  
        return;  
    }  
}
```

```
    struct Node* temp = front;  
    front = front->next;
```

```
    if (front == NULL) {  
        rear = NULL;  
    }  
}
```

```
    free(temp);  
}
```

```
void printFrontRear() {  
    if (front == NULL) {  
        printf("Queue is empty.\n");  
    } else {  
        printf("Front: %d, Rear: %d\n", front->data, rear->data);  
    }  
}
```

```
int main() {  
    int n, data;  
    scanf("%d", &n);  
    for (int i = 0; i < n; i++) {  
        scanf("%d", &data);  
        enqueue(data);  
    }  
    printFrontRear();  
    printf("Performing Dequeue Operation:\n");  
    dequeue();  
    printFrontRear();  
}
```

```
} return 0;
```

**Status :** Correct

**Marks :** 10/10
